Regular expressions

ian.mcloughlin@gmit.ie

Regular expressions

$$(0.0|1.1).(0.1) * .(0.0|1.1)$$

- Regular expressions are strings that represent patterns of text.
- The strings can contain special characters.
- Brackets can be used to group characters together.
- Regular expressions are used to search other strings for patterns.

Special characters

. means *concatenate*. So, $a.b$ means an a followed by a b.

| means *or*. So, $a|b$ means an a or a b.

* means *zero of more times*. So, a^* means zero or more a's.

Examples of regular expressions

$a.b.c$ – a single a followed by a single b followed by a single c.

$a.b.c^*$ – an a followed by a b followed by zero or more c's.

$a|b.c$ – an a, or a b followed by a c.

$(a|b).c$ – an a or a b, followed by a c.

$0.0.(0|1)^*$ – all strings of 0's and 1' that begin with two zeros.

1^* – any number of 1's (including empty string).

Precedence

1. Always apply * first.

2. Apply . after * but before |.

3. Apply | last.

4. Treat bracketed groups as individual characters.

Infix and postfix

It is sometimes convenient to re-write expressions in postfix. This applies to lots of different expressions, not just regular expressions.

Example

The infix mathematical expression "$(3+4) \times 5$" is "$3 \ 4 \ + 5 \ \times$" in postfix.

Example

The infix regular expression "$a.(b.b)^*.a$" is "$abb.^*.a.$" in postfix. Note we often omit the . in infix notation: "$a(bb)^*a$" but can't in postfix. However, the brackets aren't needed in postfix.
